

## Seeding F.A.Q – Daniel Lawn Care

**Seeding:** to bear or shed seed

### Seeding-Where should it be done?

- Large bare areas
- Thin or bare areas in the shade
- Damaged areas from diseases or insects

Areas to be seeded will be power raked to loosen the soil and prepare the seedbed. Seed and starter fertilizer will then be broadcast over the area. The area will then be power raked "lightly" going in the opposite direction to set the seed in the seed bed insuring good seed soil contact.

### Benefits of Spot Seeding Your Lawn

This method of seeding is most effective for shady areas. Large bare areas can be effectively renovated, thus avoiding the high cost of sodding. Damaged areas can be spot-seeded, thus avoiding the cost of seeding the whole lawn.
